

Second-Hand Car Sales Price Analysis

A comprehensive exploratory analysis examining 50,000 second-hand car sales records. This report uncovers key trends and relationships influencing pricing in the used vehicle market, analysing manufacturer positioning, engine specifications, manufacturing years, and fuel types to reveal what drives resale value.

Luxury Brands Dominate Resale Values

Premium Positioning Maintains Value

Analysis of average prices across manufacturers reveals a striking gap between luxury and economy brands. Porsche commands the highest resale value, followed closely by BMW, whilst Toyota, Ford, and VW cluster at significantly lower price points.

This disparity reflects strong brand equity in the luxury segment, where performance heritage and prestige contribute to sustained resale values in the second-hand market.

Engine Size and Fuel Type Shape Market Segments

Performance vs Economy

BMW and Porsche offer larger engines with medians around 3.0L, positioning them for performance enthusiasts. In contrast, Ford, Toyota, and VW typically feature 1.5L engines, targeting fuel economy and practicality.

Hybrid Premium

Hybrid vehicles demonstrate the widest price range and highest median values. Petrol and diesel cars show tighter, lower distributions. This premium reflects growing demand for fuel efficiency and environmental credentials in the resale market.

Manufacturing Year Drives Exponential Price Growth

The Depreciation Curve

Price trends reveal a clear upward trajectory correlating with manufacturing year. Values rise gradually through the 2000s before accelerating sharply post-2010, with prices peaking around 2022 models.

This exponential pattern reflects the combined impact of standard depreciation, technological advancement, and sustained demand for recent models equipped with modern safety features and connectivity.

- ❏ **Key Takeaway:** Newer vehicles command premium prices, with post-2010 models showing particularly strong resale value retention in the current market.
